

# Storage location data

At the moment, Genkgo's data is being saved via our hosting provider and subcontractor Vboxx. The data center in which the servers are located is the EvoSwitch AMS1 data center in Haarlem and in the datacenter of Maincubes at Schiphol. This data center runs on 100% renewable energy and was the first certified data center in the Netherlands that is completely carbon free. At the moment, EvoSwitch uses a combination of wind energy, hydro and biomass. The data center is provided with the necessary certifications.
